

neQis RO Water Plant Monitoring

Revolutionary
Predictive
Monitoring

RO Plants are designed to supply treated water within a specific quality range, this can be dependent on many variables.

With an ever increasing demand for RO water and maintaining a consistent supply is becoming difficult to monitor and a user of RO water would only realise the quality is suffering when machine loads begin to fail on a regular basis.

neQis can offer a independent monitoring solution which displays logs and alarms all parameters and enables preventative action ensuring continuous supply of RO water.

With 24-hour monitoring remote access and email alerts neQis IPR offers a simple but robust solution, using any standard web browser on any internet device; PC, mobile phone or tablet.

Loop & supply temperatures differential filter pressures water conductivity.

Graphical trending, periodic reports, alarm logging and historic analysis tools allows engineering staff to make accurate assessments of the RO equipment.
